EdTech4D — Homepage Redesign

Weekly Progress Report — Week 2

Monday

1. Wireframe — Hero, Navigation & CTA Placement

Before writing any code, I laid out the homepage as a low-fidelity wireframe so layout decisions could be reviewed cheaply. The wireframe was built mobile-first at 375px, then expanded to a 1180px desktop layout using the same content blocks (per the assignment's breakpoint guidance).

- Grey boxes represent images, grey bars represent text lines, and outlined rectangles represent buttons no color or type styling, so reviewers focus on layout, not decoration.
- Every section is labelled directly on the frame: Hero, How It Works, Program Highlights, Features / Why Premium, Enroll CTA, Social Proof, FAQ / Support List, Auth Form, and Footer.
- Covers all six site pages (Home, Programs, Pricing, Success Stories, FAQ, Login/Create Account), not just the homepage, so the nav restructure could be checked in context.
- A Mobile ⇌ Desktop toggle on the page lets you flip breakpoints live instead of comparing two static images.

Nav restructure decision: the header nav order was fixed as Home → Programs → Membership → FAQ → Success Stories, with Login pulled out to its own action slot on the right, since sign-in is a high frequency action that shouldn't require opening the mobile menu.

Hero decision: primary CTA ("Explore Programs") sits directly under the sub-headline, above the trust pills the highest-attention position on both breakpoints instead of being pushed below the fold on mobile.

Tuesday

2. Homepage Prototype — HTML & CSS Build

Built the approved wireframe out as a working HTML/CSS prototype (index.html + styles.css). The main change was replacing the static hero screenshot with a live-feeling visual, matching the 'Hero' block agreed in the wireframe:

- Added two floating status badges ('Tests Passed', 'Certificate Earned') and soft background glow blobs around the laptop mockup for depth, reusing CSS scaffolding that already existed in the stylesheet but was unused.
- Respects preferred-reduced-motion falls back to static text with no animation for users who need it.

Rebuilt hero: animated terminal + floating badges + gradient laptop outline.

Wednesday

3. Responsive Implementation — Mobile & Tablet Breakpoints

Implemented and tested responsive behavior for the rebuilt hero and surrounding sections:

- Hero switches from a 2-column (copy + laptop mockup) layout on desktop to a single stacked column on mobile/tablet, matching the wireframe.
- Laptop mockup scales down and re-centers below 768px so the terminal text remains legible without horizontal scroll.
- Floating badges reflow to avoid overlapping the mockup edge on narrow viewports.
- Tested using Chrome DevTools' device toolbar (mobile emulator) at 375px (iPhone SE/12), and 1280px+ desktop to confirm no breakage between breakpoints.

Thursday

4. Layout Fixes & CTA / Visual Hierarchy Refinement

- Fixed overflow risk in the terminal text block by constraining it to the laptop screen bounds with wrapped, monospace text instead of a fixed-width image.
- Unified the laptop outline gradient with the headline's accent-text gradient (purple → pink, using the same `--purple/--pink` variables) so the hero's two focal elements read as one visual system instead of two different color ramps.
- Re-confirmed the primary CTA ("Explore Programs") remains the single highest-contrast button in the hero no competing buttons at the same visual weight.

Friday

5. Site-Wide Audit: Fixes from Last Week's Review

Alongside the homepage prototype, I worked through the issues flagged in last week's audit of the live site. Each item below shows the issue found, the change made, and a screenshot of the fixed page.

Fix 1 — Homepage entry point / "Start" CTA routing

Issue found: The "Start" call-to-action was not routing anywhere — it just kept users on the Home page instead of taking them into the sign-up/login flow, so the button felt broken and stalled the main conversion path.

Change made: Corrected the link target so "Start" now takes users to the Login page, giving new and returning users a working path into the product instead of a dead click on the homepage.

Fix 2 — FAQ split into its own page

Issue found: Frequently asked questions were previously embedded inside the “Get Started” page, making them easy to miss and cluttering the signup flow with unrelated content.

Change made: Created a standalone FAQ page (faq.html) with its own nav entry, grouped into a clean two-column question/answer grid (cancel anytime, certificates, switching programs, free trial, support, refunds).

Fix 3 — Login page — password visibility & missing navigation

Issue found: The login page was a dead end with no site navigation, and the password field gave no way to check what was typed, leading to failed sign-in attempts.

Change made: Added the full site nav bar to the login page for consistent wayfinding and added a show/hide (eye icon) toggle on the password field. Also added a clearly separated "Create an Account" action below the primary Sign In button.

Fix 4 — Forgot-password recovery flow

There was previously no way for a user to recover a lost password: a locked-out user had no self-service path back into their account.

Change made: Added a 3-step "Forgot password" modal: (1) enter account email, (2) enter a 6-digit verification code sent to that email, with a resend timer and "use a different email" fallback, (3) set a new password. Reachable directly from the Login form.

Fix 5 — Footer — added, and mismatched logo removed

Issue found: The site previously had no proper footer, and the footer area used a logo mark with colors that didn't match the site's palette, making the bottom of every page feel unfinished and off-brand.

Change made: Added a complete footer (Contact Us heading, HQ address, helpdesk email, Follow Us social icons for YouTube/Facebook/LinkedIn, and a copyright line) on the dark navy background used elsewhere in the brand, and removed the off-palette logo mark so only on-brand colours appear.

Fix 6 — Create Account page: spacing & layout

The Create Account form fields felt cramped, with inconsistent spacing between labels, inputs, and sections, making the longer signup form harder to scan.

Reworked spacing: paired fields into a 2-column grid, added an "Additional Details" divider, and gave the Premium Membership opt-in its own highlighted block.

Change made: Paired related fields (Password/Confirm Password, Email/Confirm Email) into a two-column grid, added a labelled divider before the optional "Additional Details" section, and gave consistent vertical spacing between every label/input pair so the form reads top-to-bottom without crowding.

7. Attached Source Files

- wireframe.html — Monday's full-site wireframe (mobile/desktop toggle)
- index.html, styles.css — rebuilt homepage hero prototype (Tuesday–Friday)
- edtech.zip — full site source (all pages, header/footer partials, scripts)

All files referenced in this report are attached alongside it for review and for continuing the building next week.
