

JobSkillShare (JSS) Website Audit

Week 1 Report Site Audit & Development Setup

Overview

JobSkillShare (JSS) is an IT skills training platform offering hands-on courses, live labs, and certification prep (IT Support, Cloud, Networking, Cybersecurity) for individuals and organizations.

Objective

Improve and extend JSS's existing website: audit live pages, identify UX issues, and build a prioritized improvement list to guide prototyping in Week 2. No backend site access: all work performed independently as an outside audit.

Day 1: Environment Setup & Initial Site Review

Task Given	Set up development environment (VS Code, browser DevTools, GitHub repo); review the JSS site's existing structure, navigation, and visual hierarchy; note down changes needed.
Your Work	Set up VS Code, Chrome DevTools, and a GitHub repo for the project. Browsed the full site public homepage, program pages, login, post-login dashboard, Knowledge Base, and AI Lab Assistant to build a first impression and a working site map.
Findings / Explanation	● Footer logo does not retain its original brand colors, appears flat/washed out. ● Homepage relies on dense text blocks: the hero/description isn't strong enough to hook a first-time visitor. At some point, pages feel bland (all-white) despite the intended blue dark/light theme. ● Login page uses a completely different color scheme (purple/pink gradient) vs. the blue theme used everywhere else feels like a separate website. ● Post-login dashboard presents a large amount of information at once, which feels overwhelming rather than inviting. ● Knowledge Base article listing is functional but visually plain does not contain eye catching details. ● Individual course entries in the Video Library mostly show a video count, without a meaningful description of course content. ● The built-in AI Lab Assistant works, but responses are noticeably slow.

	Program roadmap pages have good content, but it's presented in a jumbled, hard-to-scan layout rather than a clean, structured one.
Finalized Output	Initial site map plus a first-pass list of visual/branding and UX issues, logged with screenshots, carried into the Day 2–4 audits.

Screenshots — Day 1:

	
<i>Fig 1. Footer logo loses its original brand colors.</i>	<i>Fig 2. Program cards are text-heavy; page feels bland/all-white.</i>

Day 2: Homepage UX Audit

Task Given	Audit the JSS homepage: CTA placement, above-the-fold content, navigation clarity, and mobile responsiveness, using DevTools mobile view and Network tab load testing.
Your Work	Opened the homepage in Chrome DevTools mobile view (Ctrl+Shift+M): checked load time via the Network tab; tested CTA visibility and navigation findability both pre- and post-login.
Findings / Explanation	- Page load speed is good across most pages; only the AI Lab Assistant and video content load are noticeably slower. - CTAs are generally well-placed and visible on most pages. - On some post-sign-up inner pages, the CTA isn't immediately obvious that the page's purpose is conveyed mainly through the nav bar rather than the content itself.

	Navigation to program pages is easy to find; overall network speed is good.
Finalized Output	Homepage audit report covering CTA placement, load speed, and navigation clarity, with supporting screenshots.

Screenshots — Day 2:

	
<i>Fig 3. AI lab assistant works but sometimes responses are slow.</i>	<i>Fig 4. The CTA for Program page isn't very clear also in dashboard some icons have text while others have only icons.</i>

Day 3: Program / Course Catalog Audit

Task Given	Audit the program/course catalog pages: content completeness and orientation, program descriptions, enrollment flow, and visual layout.
Your Work	Reviewed multiple course pages on desktop and mobile; walked through the enrollment flow end to end.
Findings / Explanation	- Content is mostly complete, but some pages present too much information at once, making it hard to digest. - Page orientation and program descriptions are generally good. - Enrollment flow is acceptable on desktop, but on mobile it becomes dense and harder to read, especially once several pages are stacked after login.
Finalized Output	Program/catalog audit report, flagging content density and the mobile enrollment flow as the key issues to address.

Screenshots — Day 3:

Fig 6. Post-sign-in dashboard presents a large amount of information jumbled up.

Day 4: Membership & Registration Audit

Task Given	Audit the membership and registration pages: identify friction points in the sign-up flow and any missing trust signals; suggest changes to feed into prototyping.
Your Work	Went through the sign-up/registration and post-login flows on desktop and mobile; checked icon and label consistency throughout.
Findings / Explanation	- Some icons carry text labels while others don't, labeling is inconsistent across the dashboard. - The course enrollment experience on mobile is confusing: it's unclear where you are in the flow; it works fine on desktop/laptop. - Pre-login visual layout is good, but the overall color theme feels disconnected, no cohesive color combination. - Post-login, there isn't a clear, guided sequence, and the theme feels inconsistent with the pre-login experience.
Suggested Changes	- Apply one consistent color theme (blue-based, light/dark) across login, dashboard, and public pages. - Add labels to all icons for consistency. - Redesign the mobile enrollment flow with clear step indicators.

Finalized Output	Membership/registration audit report plus a documented set of suggested changes, ready to inform Week 2 prototypes.
-------------------------	---

Screenshots — Day 4:

Day 5: Priority List & Weekly Report

Task Given	Compile a single priority list from all three audits (top 8–10 items, ranked by impact), focus the rest of the day on building this Week 1 report.
Your Work	Reviewed all findings from Days 1–4, grouped them by theme, and ranked them by impact vs. effort.
Finalized Output	Top 10 priority list (below).

Top 10 Priorities

1. Unify the color theme across the entire site: public pages, login, and post-login dashboard currently read as three different products.
2. Fix the mobile enrollment flow: add clear step indicators (in the nav bar) so users always know where they are.
3. Speed up the AI Lab Assistant and video loading.
4. Restore correct brand colors on the footer logo.
5. Add labels consistently to all icons across the dashboard.

6. Rewrite some of the homepage hero after signing in Edtech so the page's purpose is clear within 5 seconds (i.e. The programs page).
7. Reduce information density on program pages: break up long text blocks with headings, icons, or collapsible sections.
8. Improve Knowledge Base cards with meaningful descriptions instead of just a video count.
9. Make CTAs on inner/post-login pages self-evident, without relying on the nav bar for context.
10. Design a clear, guided sequence for the post-login dashboard experience.

Conclusion

This concludes Week 1 of the JSS website audit. Over five days, the development environment was set up, and the homepage, programs catalog, and membership flows were each audited independently, surfacing recurring issues around visual consistency, mobile usability, and information density. These findings have been consolidated into the Top 10 priority list above, which will serve as the foundation for prototyping and design decisions next.
